

PredictNowAI

Machine Learning Engineer Intern

Task: Build a machine learning model pipeline and expose it as an API, you can use any backend framework (Flask, Streamlit, FastAPI etc).

Dataset: Please use the following dataset for building the model

https://py.predictnow.ai/get_spx_example/train. The returns column is the target variable to be predicted.

Evaluation:

The objective is not to build an accurate model but one that can be “used”. We are going to evaluate the readiness of the model in terms of real world usage - hence the related code, process and practices.

Bonus points for showing a Frontend and/or Descriptive API(Swagger) and/or Deployment to a cloud platform.

Submission: Source code via git with instructions to run and if deployed the link.

Good Luck.
